Abstract

Quick Books Availability is an application that facilitates exchange of books in the student circle. It is a multifunctional platform wherein the students will be able to search and buy second hand books and sell their previous year books amongst themselves. Thus, the prime users of the system will be students and the college librarian will act as the admin of the system. The front end of the application has been developed using Microsoft Visual Studio 2008 and the back end support is provided using Microsoft SQL Server 2012. The .apk file of the application has been generated using the Eclipse IDE. Consequently, this application can be accessed from all the internet enabled devices. Hence, the objective of this application is to ease out the burden of students to look for second hand books in different stores and to give one stop solution to this problem.
